I cannot set up multiple VPN tunnels on my pfsense router because all ProtonVPN Wireguard router configs have the same interface IP address (10.2.0.2). pfSense requires each interface to have a unique IP. How do I fix this?

Help!

I am a paid Proton VPN user. I am trying to set up multiple VPN connections to my pfsense installation so I can do some policy routing and fail-over.

When setting up a Wireguard VPN connection in pfSense the tunnel must be assigned to an interface with a unique interface IP address. This is fine with 1 ProtonVPN tunnel but because they all use the same interface IP (10.2.0.2) more that 1 tunnel is not possible. The exact error message is:

The following input errors were detected:

IPv4 address 10.2.0.2/32 is being used by or overlaps with: PROTONVPNTUN1 (10.2.0.2/32)

How do I get around this issue?

Is there any timeline of when/if this will be updated? Other VPN providers provide unique IP addresses to allow simultaneous tunnels for fail over. I'll be switching to one of them until this gets resolved.

I know it's not a perfect solution, but you could run the second VPN as an OpenVPN tunnel.

I hit exactly the same issue this morning and was about to post about it - I can't migrate my pfSense over from OpenVPN because of this issue.

I use NAT 1:1 and NAT Outbound rules, I made a post about it here.

Also came up against this issue. Its pretty rubbish that it does use different IPs.

proton has now fixed this: it's possible to open multiple wireguard connections simultaneously without needing NAT workarounds.

Customer support responded to someone asking this question earlier this year (April 2024):

"Regarding the feature request, you should be able to use 10.3.0.1 for gateway/DNS, and 10.3.0.2 for your IP.

It also works for 10.4.0.x, 10.5.0.x, etc. (the important thing is that the gateway should be .1)"

<https://protonmail.uservoice.com/forums/932836-proton-vpn/suggestions/47593508-pfsense-wireguard-multiple-gateways>

I can confirm this works.

One note of caution: if you're also a airVPN wireguard user and have tunnels on the same machine, there is a potential clash/overlap with [10.4.0.1](#) (airVPN DNS).

Increment your instance's IP address like this:

```
interface0  
address = 10.2.0.2/32  
(monitor IP 10.2.0.1)
```

For next interfaces:

```
interface1  
address = 10.3.0.2/32  
(monitor IP 10.3.0.1)  
  
interface2  
address = 10.4.0.2/32  
(monitor IP 10.4.0.1)
```

In your peer, increment port number as well, so:

```
peer0  
endponit = <ip address>:51820
```

For next peers:

```
peer1  
endponit = <ip address>:51821  
  
peer2  
endponit = <ip address>:51822
```

I was able to set up more than one Proton VPN Wireguard connections in Opnsense

I'm trying to set up 2 proton wireguard tunnels with one as a failover. I set up like above to avoid the conflict and created a gw for each and then a gw group alias with both contained in the group name. I then combined OPT1 and OPT2 interfaces into an interface alias and set NAT rules to use the alias. What I see is the first gw being used and the 2nd one never completing a handshake so I feel I'm missing something in firewall rules or NAT setup -- any ideas where to look in more detail?
