Let's assume, I install the Server in that way, that I have one dedicated disk for the OS and one dedicated disk for the datastore.

When I have to replace the OS disk for any reason and reinstall from scratch, is there any way to import the datastore disk or are all the backups lost?

When I simply try to recreate it, it ends up with Error: unable to create chunk store 'ds1' subdir "/var/lib/vz/dump/.chunks" - EEXIST: File exists

Cheers,
luphi

All important data, chunks and indexes are stored in the datastore path. So, just re-add it under the same path.

For now, you can simply add it to `/etc/proxmox-backup/datastore.cfg`:

Code:

```
datastore: name
           path /path/to/previous/ds
```

The respective add command will be enhanced to make such a process easier.

Best regards,
Thomas

I agree with this post.
I have the opposite example.

I had to replace the data disk where the backups are saved. I copied everything from the old disk to the new one, I edited the cfg file but when I go to browse the contents of the datastore I get this error

Code:

```
Bad Request (400)
unable to detect file type
```

[SOLVED]

In case of data disk replacement, you need to change the folder permissions.

```
chown backup:backup .chunks ct vm .locks -R
```

solved my problem

Ok, and if the path is no longer known?

You could search for all directories containing a `.chunks` sub-directory, as those normally distinguishes datastores.

For example, by using the following command:

Bash:

```
find / -type d -path '*/.chunks/*' -prune -o -name '.chunks' -pr
```

note that while this is already a bit optimized (doesn't enters any found `.chunks` avoiding to search lots of directories) it still searches the whole filesystem tree and all its mounted filesystems, so it may be quite slow.

Best regards,
Thomas

I edit the datastore.cfg

I can see the datastore in PBS.

I can create new backup to datastore from Proxmox
however i cant see all the previous backup data.

Update:

I notice datastore use some kind of encoding as it was mount from samba.
Rename it seems to fix the issue .

I am sharing incase someone having same issue

Code:

```
PBS:/mnt/hdd/pbs/ct/111# ls -la
total 24
drwxrwxrwx 5 backup backup 4096 Oct 24 17:44 .
drwxrwxrwx 6 backup backup 4096 Oct 24 17:40 ..
drwxrwxrwx 2 backup backup 4096 Oct 23 22:34 '2022-10-23T09'$'\3
drwxrwxrwx 2 backup backup 4096 Oct 23 22:34 '2022-10-23T10'$'\3
drwxr-xr-x 2 backup backup 4096 Oct 24 17:44 2022-10-24T17:44:3
-rw-rw---- 1 backup backup 10 Oct 23 09:49 owner
```

I can't make it running ...

I edited the cfg

```
GNU nano 7.2
datastore: SynologyNAS
path /nas/ProxMox-Backup
```

but it allways state Datastore not available

check with mount command if your nas is mounted. nfs or samba require mount to be browsable.

#12

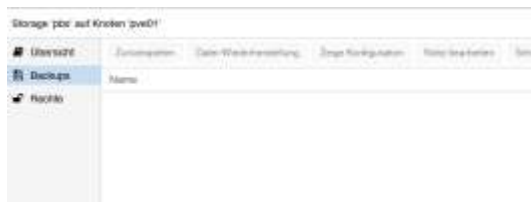

Thanks for the hint. I found it

Now I can add the pbs to my storages, but still can't see the backups.

A verify show me this:

So it seems I'm on the right way, but still missing the backups

fix file system permissions with :

```
chown backup:backup -R /path/to/your/datastore
```

Famous Member

```
chmod -R 700 /path/to/your/datastore
```

Da bekomme ich viele Fehler:

myssv
Member

Jul 9, 2024

#15

I tried this:

```
touch /mnt/backup/test_file
```

and the file was created.

Tha datastore is on a Synology NAS.

I found the problem, same as [here](#)

I had to rename some directorys:
